Project name	A Crm Application for Banquet Hall Booking
Maximum marks	

Chapter – 4

Project Design

4.1 Existing System:

Most traditional banquet hall booking systems rely on manual processes or basic digital tools like spreadsheets, phone calls, and paper records. These systems typically involve:

- Customers visiting halls physically to check availability
- Staff manually recording bookings and payments
- No centralized database for tracking services or customer preferences
- Limited or no automation for notifications, approvals, or conflict detection
- Difficulty in generating reports or analyzing business performance

✖ Problems in the Existing System

Issue	Impact
Manual Booking	Time-consuming, prone to errors and double bookings
Lack of Real-Time Availability	Customers can't check hall availability instantly
Poor Service Coordination	Catering, décor, and other services managed separately

A CRM APPLICATION FOR BANQUET HALL BOOKING

No Customer Portal	Customers rely on calls or visits for updates
Limited Reporting	No insights into occupancy, revenue, or customer satisfaction
Inconsistent Communication	Delays in confirmations and reminders

✅ **Solution Fit: Salesforce-Based System**

Your proposed system solves these problems by leveraging Salesforce CRM and automation tools:

- **Real-Time Booking Portal:** Customers can view availability and book instantly
- **Centralized Data:** All bookings, services, and customer info stored securely
- **Automation:** Flows and Process Builder handle approvals, reminders, and validations
- **Service Integration:** Catering, décor, and entertainment linked to each booking
- **Analytics & Dashboards:** Track performance, trends, and customer feedback
- **Experience Cloud Portal:** Offers a seamless, branded customer interface

This fit between the problem and solution ensures improved efficiency, customer satisfaction, and business growth.

4.2 Proposed System Overview

The proposed system is a cloud-based CRM solution built on Salesforce that automates and centralizes the entire banquet hall booking process. It replaces manual workflows with intelligent, user-friendly modules that improve efficiency, reduce errors, and enhance customer satisfaction.

Key Features of the Proposed Solution

Feature	Description
Real-Time Booking Portal	Customers can check availability, select services, and book instantly via Experience Cloud
Centralized Data Storage	All booking, customer, and service data stored securely in Salesforce Custom Objects
Automation & Validation	Flows and Process Builder automate approvals, prevent double bookings, and send reminders
Service Integration	Catering, décor, entertainment, and photography linked directly to each booking
Admin Dashboard	Staff can manage bookings, assign tasks, and monitor KPIs from a single interface
Analytics & Reports	Dashboards provide insights into revenue, occupancy, customer feedback, and trends
Feedback Module	Post-event reviews collected to improve service quality and customer retention

Benefits of the Proposed System

- **Efficiency:** Reduces manual work and speeds up booking and coordination
- **Transparency:** Customers get clear pricing, availability, and service options
- **Scalability:** Supports multiple venues and service providers
- **Security:** Role-based access and encrypted data handling
- **Customer Experience:** Seamless portal access, automated communication, and personalized service

This system is designed to be **modular, scalable, and user-centric**, making it ideal for banquet halls looking to modernize operations and grow their business.

4.3 Solution Architecture

High-Level Architecture Layers

Layer	Components
Presentation Layer	Salesforce Lightning UI, Experience Cloud Portal (for customers)
Application Layer	Apex Classes, Lightning Components, Flows, Process Builder
Data Layer	Custom Objects (Halls, Bookings, Services, Customers, Payments)
Integration Layer	Email/SMS APIs, Payment Gateway, Calendar Sync, External Service Connectors
Analytics Layer	Reports, Dashboards, Einstein Analytics (optional)
Security Layer	Roles, Profiles, Permission Sets, Sharing Rules

Component Interaction Flow

1. Customer Portal (Experience Cloud)
 - Customers browse halls, check availability, and submit booking requests.
 - Portal uses Lightning Pages and Custom Components for UI.
2. Booking Engine (Custom Object + Flow)
 - Booking request triggers a Flow that checks availability and validates inputs.
 - If valid, booking is stored and linked to customer and selected services.
3. Service Integration
 - Catering, décor, and entertainment services are linked via related objects.
 - Admins can assign vendors and track service status.
4. Notifications & Approvals
 - Process Builder or Flow sends automated emails/SMS for confirmations and reminders.
 - Admins receive approval requests via Tasks or Email Alerts.

5. Admin Dashboard

- Built using Lightning App Builder and Reports.
- Displays KPIs like occupancy rate, revenue, and customer feedback.

6. Analytics & Feedback

- Post-event feedback collected via Forms or Surveys.
- Dashboards visualize trends and customer satisfaction.

Security & Access Control

- Role Hierarchy: Defines access levels for Admins, Staff, and Customers.
- Profiles & Permission Sets: Control object-level and field-level access.
- Sharing Rules: Ensure bookings are visible only to relevant users.

Optional Enhancements

- Einstein AI: Predict peak booking periods and recommend services.
- Slack Integration: Notify staff of new bookings or changes.
- Mobile App: Extend portal access via Salesforce Mobile SDK.
